

Samba Server TASK – 9

- 1. Install Samba on your Linux system and create a shared folder named 'music-share' that is accessible from Windows machines on your local network.**

Ans :

- # Install Samba
Yum install -y samba
- # Create the shared folder
mkdir -p /srv/music-share
- # Set permissions
chmod 777 /srv/music-share
- # Backup Samba configuration
cp /etc/samba/smb.conf /etc/samba/smb.conf.bak
- [music-share]
path = /srv/music-share
browseable = yes
writable = yes
guest ok = yes
read only = no
create mask = 0777
directory mask = 0777
- # Restart and enable Samba services
systemctl restart smbd
systemctl restart nmbd

```
systemctl enable smbd  
systemctl enable nmbd
```

- # Check Samba service status
sudo systemctl status smbd

**2. Configure Samba to allow only users 'partyuser' and 'guestuser' to access the 'music-share' folder, and set a Samba password for each user.

Hint: Use the smbpasswd command to set Samba passwords after creating the Linux users.**

Ans :

- # Create Linux users
useradd -m partyuser
useradd -m guestuser
- # Set Linux passwords
passwd partyuser
passwd guestuser
- # Create Samba passwords
smbpasswd -a partyuser
smbpasswd -a guestuser
- # Enable the Samba users
smbpasswd -e partyuser
smbpasswd -e guestuser
- # Set ownership and permissions for the shared folder
chown -R partyuser:partyuser /srv/music-share
chmod -R 770 /srv/music-share

- # Edit the Samba configuration
nano /etc/samba/smb.conf
- [music-share]
path = /srv/music-share
browseable = yes
writable = yes
read only = no
valid users = partyuser guestuser
guest ok = no
create mask = 0770
directory mask = 0770
- # Restart Samba services
systemctl restart smbd
systemctl restart nmbd
- # Check Samba status
systemctl status smbd

3. Edit the smb.conf file to make the 'music-share' folder read-only for 'guestuser' but read/write for 'partyuser'.

Ans :

- sudo nano /etc/samba/smb.conf
- [music-share]
path = /srv/music-share
browseable = yes
read only = yes
valid users = partyuser guestuser
write list = partyuser
guest ok = no
create mask = 0770

directory mask = 0770

- # Restart Samba services
systemctl restart smbd
systemctl restart nmbd
- # Verify the services are running
systemctl status smbd

4. From a Windows machine or VM, connect to the 'music-share' Samba share using the 'partyuser' account and copy a sample MP3 file into the share. Then verify from Linux that the file appears in the shared folder.

Ans :

- Press **Win + R** and enter:
\\<Linux_Server_IP>\music-share
- When prompted, log in with:
Username: partyuser
Password: <your_samba_password>
- Copy a sample MP3 file (for example, song.mp3) into the **music-share** folder.
Go to the shared folder
cd /srv/music-share

List the files
ls -lh

Verify the MP3 file exists
ls -l *.mp3

**5. Restart the Samba service and use the smbstatus command to check if any clients are currently connected to your Samba share.

Hint: If no clients are**

connected, try accessing the share from another device first.

Ans :

- # Restart the Samba services
systemctl restart smbd
systemctl restart nmbd
- # Verify the Samba services are running
sudo systemctl status smbd
- # Check for connected Samba clients
sudo smbstatus
